EASY SOLUTIONS BULLETIN

Metal Sealing Rings on all Link Stabilizers

Challenge

It is standard practice to use plastic sealing rings on stabilizer link bars. However, MOOG found there are some disadvantages as over time they can lose their optimum tightness. As a result dirt and water can penetrate through the seal causing a reduced performance of the ball stud which in turn leads to early wear and subsequent failure.

Easy Solutions

To overcome this MOOG has changed all the plastic upper sealing rings to metal versions. The premium metal rings ensure an optimum tightness over a longer period of time which guarantees a longer part life by avoiding water and dirt contaminating the ball stud.
